Environmentalists Urge EPA To Accelerate Cr6 Drinking Water Standard

August 16, 2016

Environmentalists are urging EPA Administrator Gina McCarthy to set a drinking water standard for hexavalent chromium (Cr6) as soon as possible, expressing concerns about the agency's failure to finalize, after eight years of work, a risk assessment of the metal that would allow EPA to move forward with a new standard.

"We write with deep concern about this continued delay," Environmental Working Group (EWG) President Ken Cook and consumer advocate Erin Brockovich write in an Aug. 16

letter<http://insideepa.com/sites/insideepa.com/files/documents/aug2016/epa2016_1741.pdf> to McCarthy. "It is clear that the delay is sowing confusion among state and local regulators, utilities and the public about how much hexavalent chromium is safe in drinking water. This confusion is resulting [in] many Americans' exposure to unregulated levels of [Cr6] . . ."

The advocates' letter to McCarthy follows the resignation of North Carolina's state epidemiologist, Megan Davies, over disagreements with other state officials on how to limit residents' exposure to Cr6 in drinking water wells near Duke Energy's coal ash pits. EWG and Brockovich argue in their letter that EPA's inaction on a federal Cr6 standard left Davies without an enforceable basis for her concerns about the levels of Cr6 in drinking water wells that did not exceed the federal standard but which advocates call outdated.

EWG and other advocates have long argued that the existing federal chromium standard is inadequate, in part because they say it inappropriately combines multiple forms of chromium. The 100 micrograms per liter (ug/L) of water standard, set in 1991, is for total chromium, a mixture of Cr6 and trivalent chromium (Cr3). While Cr6 is a carcinogen, Cr3 is an essential nutrient.

EWG argues that a drinking water standard, or maximum contaminant level (MCL), "for these two kinds of chromium combined conflates the individual risk of each chemical and allows for legally permissible [Cr6] levels that do not adequately protect public health. EPA should instead set an MCL specifically for [Cr6] to more accurately reflect the actual level of risk posed by [Cr6] alone."

EPA Assessment

EPA released a draft Integrated Risk Information System (IRIS) assessment of oral Cr6 risks in 2010, but that draft was shelved after a controversial 2011 peer review panel, where several members recommended that the agency delay the assessment until industry consultants completed a series of studies investigating the biological mechanism for how Cr6 causes cancer after ingestion. Environmentalists later questioned some of the reviewers' industry ties.

The agency in 2014 re-started the IRIS<<http://insideepa.com/node/168017>> assessment, releasing preliminary scoping documents later that year. A public draft has yet to be released, but may be planned for 2017, an industry source says.

The consultants' subsequent publications have questioned a 2008 study of rodents by the National Toxicology Program, which first raised concern over oral exposures to Cr6, suggesting that the studies are not applicable to Americans' risks given their much lower exposure levels in drinking water. Using that information, the Texas Commission on Environmental Quality last month released a draft Cr6

assessment<<http://insideepa.com/node/193049>> indicating that the existing federal standard is health protective.

EWG, however, cites California's decision to set its own Cr6 standard of 10 ug/L -- a number that EWG considers insufficiently protective, even though it is significantly stricter than the federal standard. North Carolina's Cr6 standard is weaker, though it falls within the federal standard, EWG writes.

"While questions remain about what level of exposure to [Cr6] is safe, there is scientific consensus that the chemical is hazardous at extremely low concentrations," the letter states. "States like North Carolina, where industrial byproducts like coal ash increase the risk of [Cr6] contamination, need a federal mandate to set strong, health-protective standards. . ."

Noting it has been eight years since EPA began assessing Cr6 risks, the group urges McCarthy to set a new

MCL “as soon as possible.” -- Maria Hegstad (mhegstad@iwpnews.com<<mailto:mhegstad@iwpnews.com>>)
